EDUCATION

University of British Columbia

B.Sc. Major in Computer Science (UBC Co-op Program)

- GPA: 3.8/4.0, Dean's List

Expected Graduation: May 2028

Vancouver, BC

PERSONAL PROJECTS

[AirBnb Rating Predictor](#) | *Python, Scikit-Learn*

Feb 2026 - Mar 2026

- Achieved an **RMSE of 0.98** predicting monthly review rates by engineering and comparing multiple **regression models** (Random Forest, Ridge, Linear Regression) across **49,000+** NYC Airbnb listings.
- Reduced model error by **20%** and outperformed baseline model by **40%** through feature engineering and hyperparameter tuning via cross-validation, improving generalization on unseen listings.
- Preprocessed and cleaned a **49,000-row** dataset by handling missing values, encoding categorical features, and normalizing skewed distributions, reducing data noise and improving pipeline reliability.

[Personal Portfolio](#) | *React, Tailwind CSS*

Dec 2025 - Feb 2026

- Designed a portfolio using React, Framer Motion, and GSAP, featuring animated project showcases and a responsive layout.
- Achieved a **95+ Lighthouse performance score** by optimizing asset loading and implementing responsive design across all viewports.
- Deployed via **Vercel** with continuous deployment pipeline triggered on every GitHub push.

[OctoPod: Your Personal Tutor](#) | *React, Gemini REST API*

Nov 2025 - Dec 2025

- Delivered dynamic, context-aware tutoring responses by engineering a real-time AI platform integrating **React** with the **Gemini REST API**.
- Reduced Time to First Token (TTFT) by **50%** and achieved **<1s** response delivery by optimizing API performance through asynchronous request handling and streamed responses.
- Improved response relevance by **20%** and eliminated off-topic hallucinations by designing a structured system prompt to prime the Gemini API with context and constraints before user input.

[Sudoku Puzzle Generator](#) | *Java, Java Swing*

Jan 2025 - May 2025

- Engineered a Sudoku engine generating randomized puzzles across 3 difficulty tiers, tuning cell removal rates per difficulty to ensure consistent challenge scaling.
- Achieved **90%** test coverage across core game logic using **JUnit5**, validating puzzle generation and state management, and edge case handling.
- Implemented **data persistence** via JsonReader and JsonWriter, enabling seamless save/resume functionality and reducing session restart rate.

EXTRACURRICULAR

Ignition Hacks

Software Developer

March 2026 - Current

Burnaby, BC

- Developed a full-stack applicant registration system using React and MongoDB, enabling reliable data collection and storage for **500+** expected hackathon participants.
- Engineered a responsive hackathon landing page using React and Framer Motion, delivering high-performance UI components to drive applicant sign-ups.

TECHNICAL SKILLS

Languages: Java, JavaScript, Python, C/C++, Assembly, HTML/CSS, JSON, R

Frameworks: React, TailwindCSS, NumPy, Pandas, Next.js, Node.js, Java Swing, JUnit5

Developer Tools: Git, VS Code, Visual Studio, IntelliJ, Vercel, Figma

Libraries: Scikit-learn, Matplotlib, SHAP, Framer Motion, GSAP

Interests and Hobbies: (Competitive) Badminton, Digital art, Bodybuilding, Mahjong
